## **A Step Toward Speeding Up Cross-Cut Shredded Document Reconstruction**

Recovery of shredded documents helps in security informatics, forensic and investigation science. Shredded document reconstruction requires much time and human effort. Hence, there is a great need to enhance its performance due to the high growth of critical cases requiring fast shredded document reconstruction. In this paper, we focus particularly on the most influential sub-problem which is enhancing and speeding up the matching process in addition to reducing the search space. Furthermore, fully automated pre-processing, feature extraction and matching are applied in order to minimize the user interaction and reduce the time needed for reconstructing enormous number of shredded documents.
